Guide 3, 15 minutes, 4 steps

Personal data and AI

What to mask and what to keep in-house before text reaches a model. Written for teams under KVKK, the Turkish data protection law.

This PDF is the printed version of an interactive guide. To run the experiments yourself: **halilneed.agency/guides/personal-data/**

Step 1 of 4

Three routes for any text

Six work texts. Choose the route for each one.

Ask for title ideas for the Q3 sales presentation

As is | Mask | Keep in

As is. No personal data, it can go as is.

Customer Ayşe Yılmaz, 0532 111 22 33, complains her parcel is late; draft a reply

As is | Mask | Keep in

Mask. The name and phone number are not needed for the reply. Mask them and the draft still works.

An employee's sick-leave length and diagnosis: a slipped disc; plan the leave

As is | Mask | Keep in

Keep in. Health data is special-category personal data. Keep it in-house.

Company notice: the office closes at 3pm on Friday; fix the wording

As is | Mask | Keep in

As is. No personal data.

A customer's IBAN and three months of account activity; summarise it

As is | Mask | Keep in

Keep in. Banking secrecy and financial data. It does not leave the company.

Meeting note: Mehmet approved the budget, Zeynep will prepare the deck; make an action list

As is | Mask | Keep in

Mask. Mask the names and put them back when the list returns.

Step 2 of 4

Masking with rules and a model

Switch on the rules, then the model. Which one catches what?

No masking | Rules | Model | Rules and model

Customer [NAME] (national ID [ID]) called yesterday from [PHONE]. Email: [EMAIL]. IBAN for the refund: [IBAN]. Address: [ADDRESS].

Caught: **6 / 6** Missed: **0**

The sample text is made up and the rule and model results are illustrative. A real Turkish masking model (0.944 exact match on 1,000 rows): turkish-pii-detection

Together: fixed formats to the rules, the rest to the model. Most real systems work this way.

Step 3 of 4

What a recall figure means per day

Change the volume and the recall, and see what gets through unmasked.

Texts processed per day **2,000**

Share of texts with personal data **30%**

Masking recall **98.0%**

12	264	3,000
missed per day	missed per month	missed per year

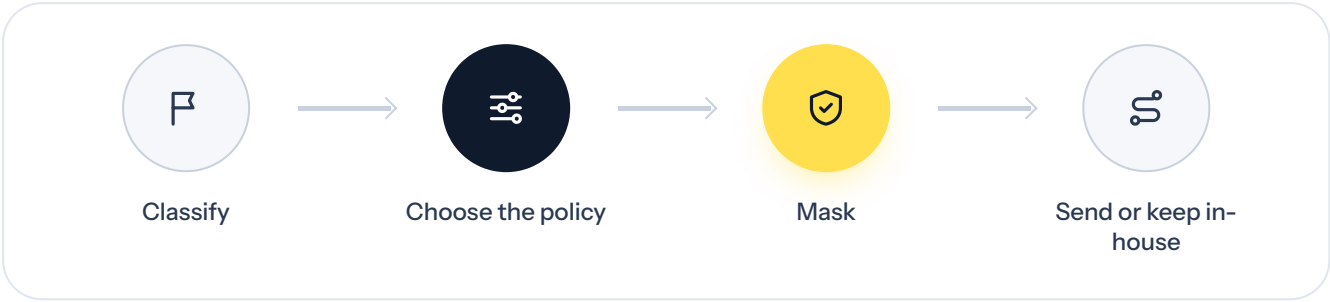

Assumes one piece of personal data per text, 22 working days a month and 250 a year.

With these settings about 264 pieces of personal data get through unmasked every month. A high percentage is not small once it meets volume.

Step 4 of 4

The safe flow

Four steps before text goes to a model.

Classify first, then decide

Special-category data stays in

Measure masking slice by slice

Write the rule with your legal team

This guide is not legal advice. For decisions under KVKK, consult your legal team.

All four guides

Interactive page and PDF, in English and Turkish.
